

Scenario A test case:

Scenario A represents a normal mixed workload with different arrival times, burst times, and priorities. The following processes were used in the test:

Process	Arrival Time	Burst Time	Priority
P1	0	5	2
P2	1	3	1
P3	2	8	4
P4	3	6	2

In this scenario, both SJF and Priority Scheduling produced the same execution order because the shortest available process also had the highest priority at the decision points.

Execution Order: P1 → P2 → P4 → P3

Average Waiting Time = 5.25

Average Turnaround Time = 10.75

Average Response Time = 5.25

This scenario demonstrates that under some workloads, different scheduling algorithms may generate identical results.
